

July 7, 2026 Learning Log: Plotting and GitHub

Summary:

This is the very start of my journey, and so far I have had to prepare my computer for the things that I will eventually need to use, such as Visual Studio Code, Python, Python Packages, Git, and GitHub. I learned how Git/GitHub works by using its commands and managed to create this repository. I also learned basic Matplotlib and Seaborn plotting with a focus on usage in realistic scenarios. I spent most of my time during this era researching and finalizing the roadmap as well as planning how to complete it.

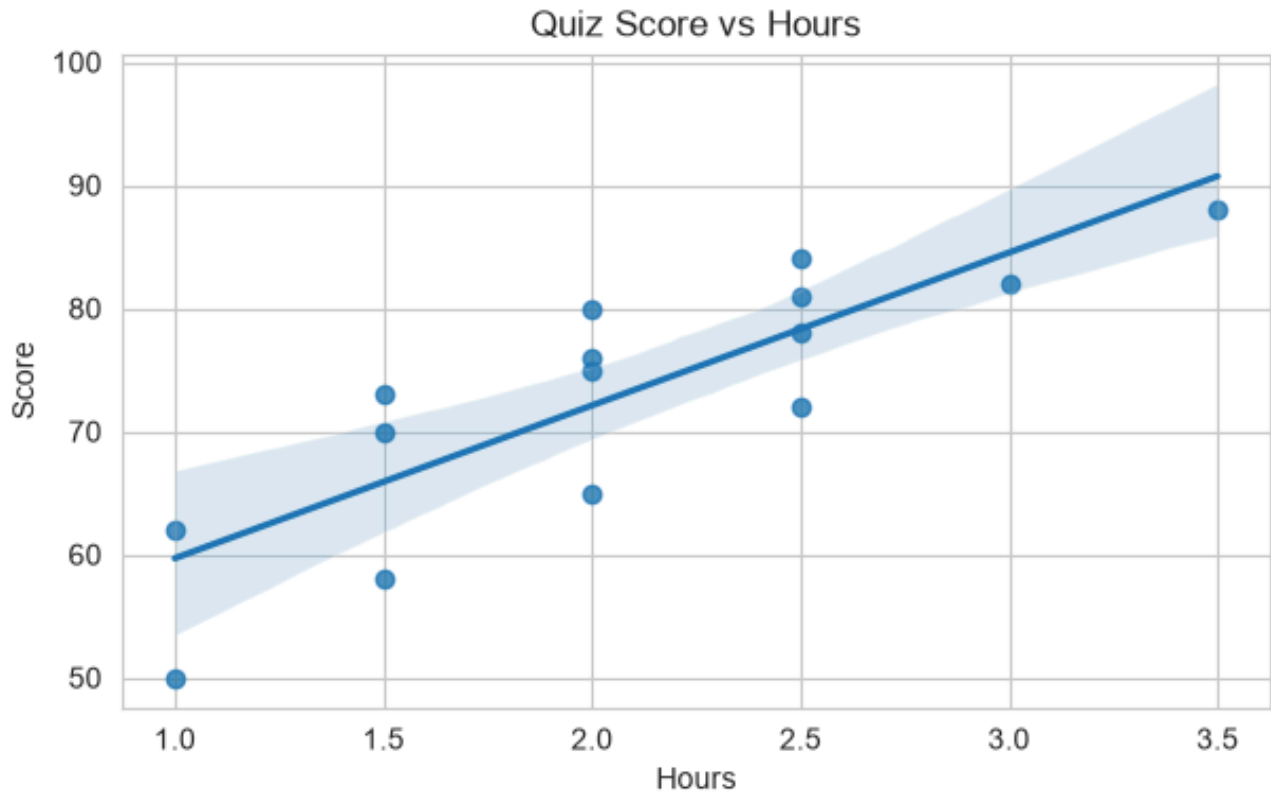

Roadmap:

- Roadmap Stage: Fully completed Stage 0. May start Stage 1
- Focuses: Plotting in Python, Git/GitHub usage and workings.

Projects /Work: (see Projects/Work folder)

Work:

- “Stage 0 Matplotlib and Seaborn plots”: Completed numerous amount of practice problems that require plotting in Seaborn or Matplotlib using a randomly generated data set. Used different types of plots such as line, scatter, and bar plots in appropriate situations. Also leveraged plot customization tools and functions.

Challenges/Difficulties and Fixes:

- Challenge: Had a difficult time remembering the syntax, especially when switching between using Matplotlib and Seaborn.
 - Fix: Leverage active recall by occasionally either remembering the syntax or completing practice problems using Matplotlib and Seaborn.

Next Steps:

Will move on to Stage 1 of the roadmap, which will mostly consist of reviewing math but with some new material, which is Linear Algebra. Will take efficient and effective notes for all of the material and use effective learning strategies that I have just learned and will attempt to implement for the first time.
